Nurse Educators' Critical Thinking Christy L. Raymond-Seniuk 2014 Critical thinking is an important indicator of student learning and is an essential outcome of baccalaureate nursing education. The role of nurse educators in the development of students' critical thinking has been overlooked despite the importance of their actions to facilitate critical thinking in nursing education. How nurse educators reveal their critical thinking in practice is also unknown. The purpose of this study was to explore nurse educators' critical thinking in clinical practice. I utilized a mixed methods triangulated design with a grounded theory approach for the qualitative phase of the research. I employed three data collection approaches including critical thinking self-assessment tools (CCTST-California Critical Thinking Skills Test and CCTDI-California Critical Thinking Disposition Inventory), participant observation, and interviews. As part of my exploration, I completed an integrative review of nursing research examining nurse educators' critical thinking. The integrative review I completed highlighted issues such as the continued lack of a consensus definition of critical thinking and the limited presence of conceptual models to guide the use of critical thinking in nursing education. As well, the integrative review illuminated the emergence of some beginning patterns in the measurement of nurse educators' critical thinking. The findings from my mixed methods study found that nurse educator participants had moderately strong critical thinking skills along with a positive inclination to think critically, as measured by the CCTST and CCTDI. These results are similar to other findings evident from the limited studies completed to date. My study captured one interpretation of how nurse educators revealed their critical thinking in clinical practice. Based on my interpretation, I created a conceptual model depicting how nurse educators' show their critical thinking in the clinical setting. The important categories of this model include: a) fostering the student-educator relationship; b) role modeling critical thinking; c) mobilizing and operationalizing resources; as well as d) balancing factors that impact nurse educators' critical thinking. My study's findings inform what is known about nurse educators' critical thinking and how it can be revealed in nurse educators' teaching practice. Given my findings, I offer recommendations for future nursing education practice and research.

Action Research for Nurses Peter McDonnell 2015-11-09 Nurses work in complex situations with daily challenges, where the needs of each patient represent unique demands. Action research helps nurses to investigate their practices as reflective practitioners, allowing them to ask 'What is going on? How do we understand the existing situation? How do we improve it?' This book supports nurses in investigating their own professional practices in order to develop the new insights and approaches: · embodying holistic perspectives in dialogical and relational forms of individual and organisational learning, · equal emphasis on processes and outcomes; · welcoming all participants' contributions , and listening to all voices; · developing a patient-centred focus where people are involved in their own healing; · building communities of enquiring practices. This book is intended for undergraduate student nurses, qualified practising

nurses in clinical settings who may or may not be engaged in formal professional education courses and nurse educators and managers. Cumulated Index Medicus 1995

From Vocational to Professional Education Jens-Christian Smeby 2014-11-27 One of the most important routes to employment within the social welfare sector worldwide is higher education, which equips students not only with the knowledge for employment, but with the tools to use and build on this knowledge. During the last few decades there has been an academic drift in professional education, especially for many shorter professional programmes. Many of these shorter programmes have left the realm of vocational education to enter higher education. On the one hand, graduates are confronted by an increased demand for research and evidence-based knowledge, and on the other, they are criticised for lacking the knowledge and skills relevant for professional work. *From Vocational to Professional Education* presents new research into programmes suggesting how best to prepare students for professional work and addresses the challenges facing the education of professionals for social welfare. The book identifies and clarifies key problems, as well as outlining the political and historical context in which they are embedded. Chapters discuss theoretical and analytical ways to address these challenges and suggest recommendations for the further development of education for professional practice. Based on comprehensive longitudinal research data, the book will appeal to policy makers, leaders of higher education, and teachers and researchers involved in programmes qualifying students for professional work.

Nurse Educator in Practice Salomé M. Meyer 2008 There is a great need for qualified nurse educators in South Africa to enhance the quality of the development of student nurses, and therefore to enhance the quality of nursing care. This book applies didactics in theoretical, as well as clinical nursing education, using examples to illustrate the text.

Theoretical Nursing Afaf Ibrahim Meleis 2011 "An additional assumption was that the processes for theory development were new to nursing and hence, nurses in graduate programs learned strategies for advancing knowledge from other disciplines. This assumption was debunked with the knowledge that nurses were always engaged in knowledge development, driven by their experiences in clinical practice. Because of these assumptions, most of the early writing about theory development was about outlining strategies that should be used, rather than strategies that have already been used in the discipline to develop theories. Theorists themselves did not uncover or adequately discuss ways by which they developed their theories, therefore the tendency was to describe processes that were based on theories developed in other disciplines, mainly the physical and social sciences. And an implicit assumption was made that there should be a single strategy for theory development, some claiming to begin the process from practice, and others believing it should be

driven by research"--Provided by publisher.
